HW01-3 Redirect Input

This program needs 3 files:

1. main.c
2. add.c
3. header.h

In HW01-1 and HW01-2, the programs' inputs are given from the command line. To run the program, type

`./hw01-2 2024 264`

The output is printed on screen.

If you want to save the output to a file, do this:

`./hw001 2024 264 > output`

The output is saved to a file called **`output.`**

We can also use redirection for inputs.

Suppose a file called **`input`** has the following contents (two numbers):

123 456

The program reads inputs using scanf. The following command will use **`input`** as the input and the output is saved to a file called **`output`**.

`./hw001 < input > output`
